

D = Demand

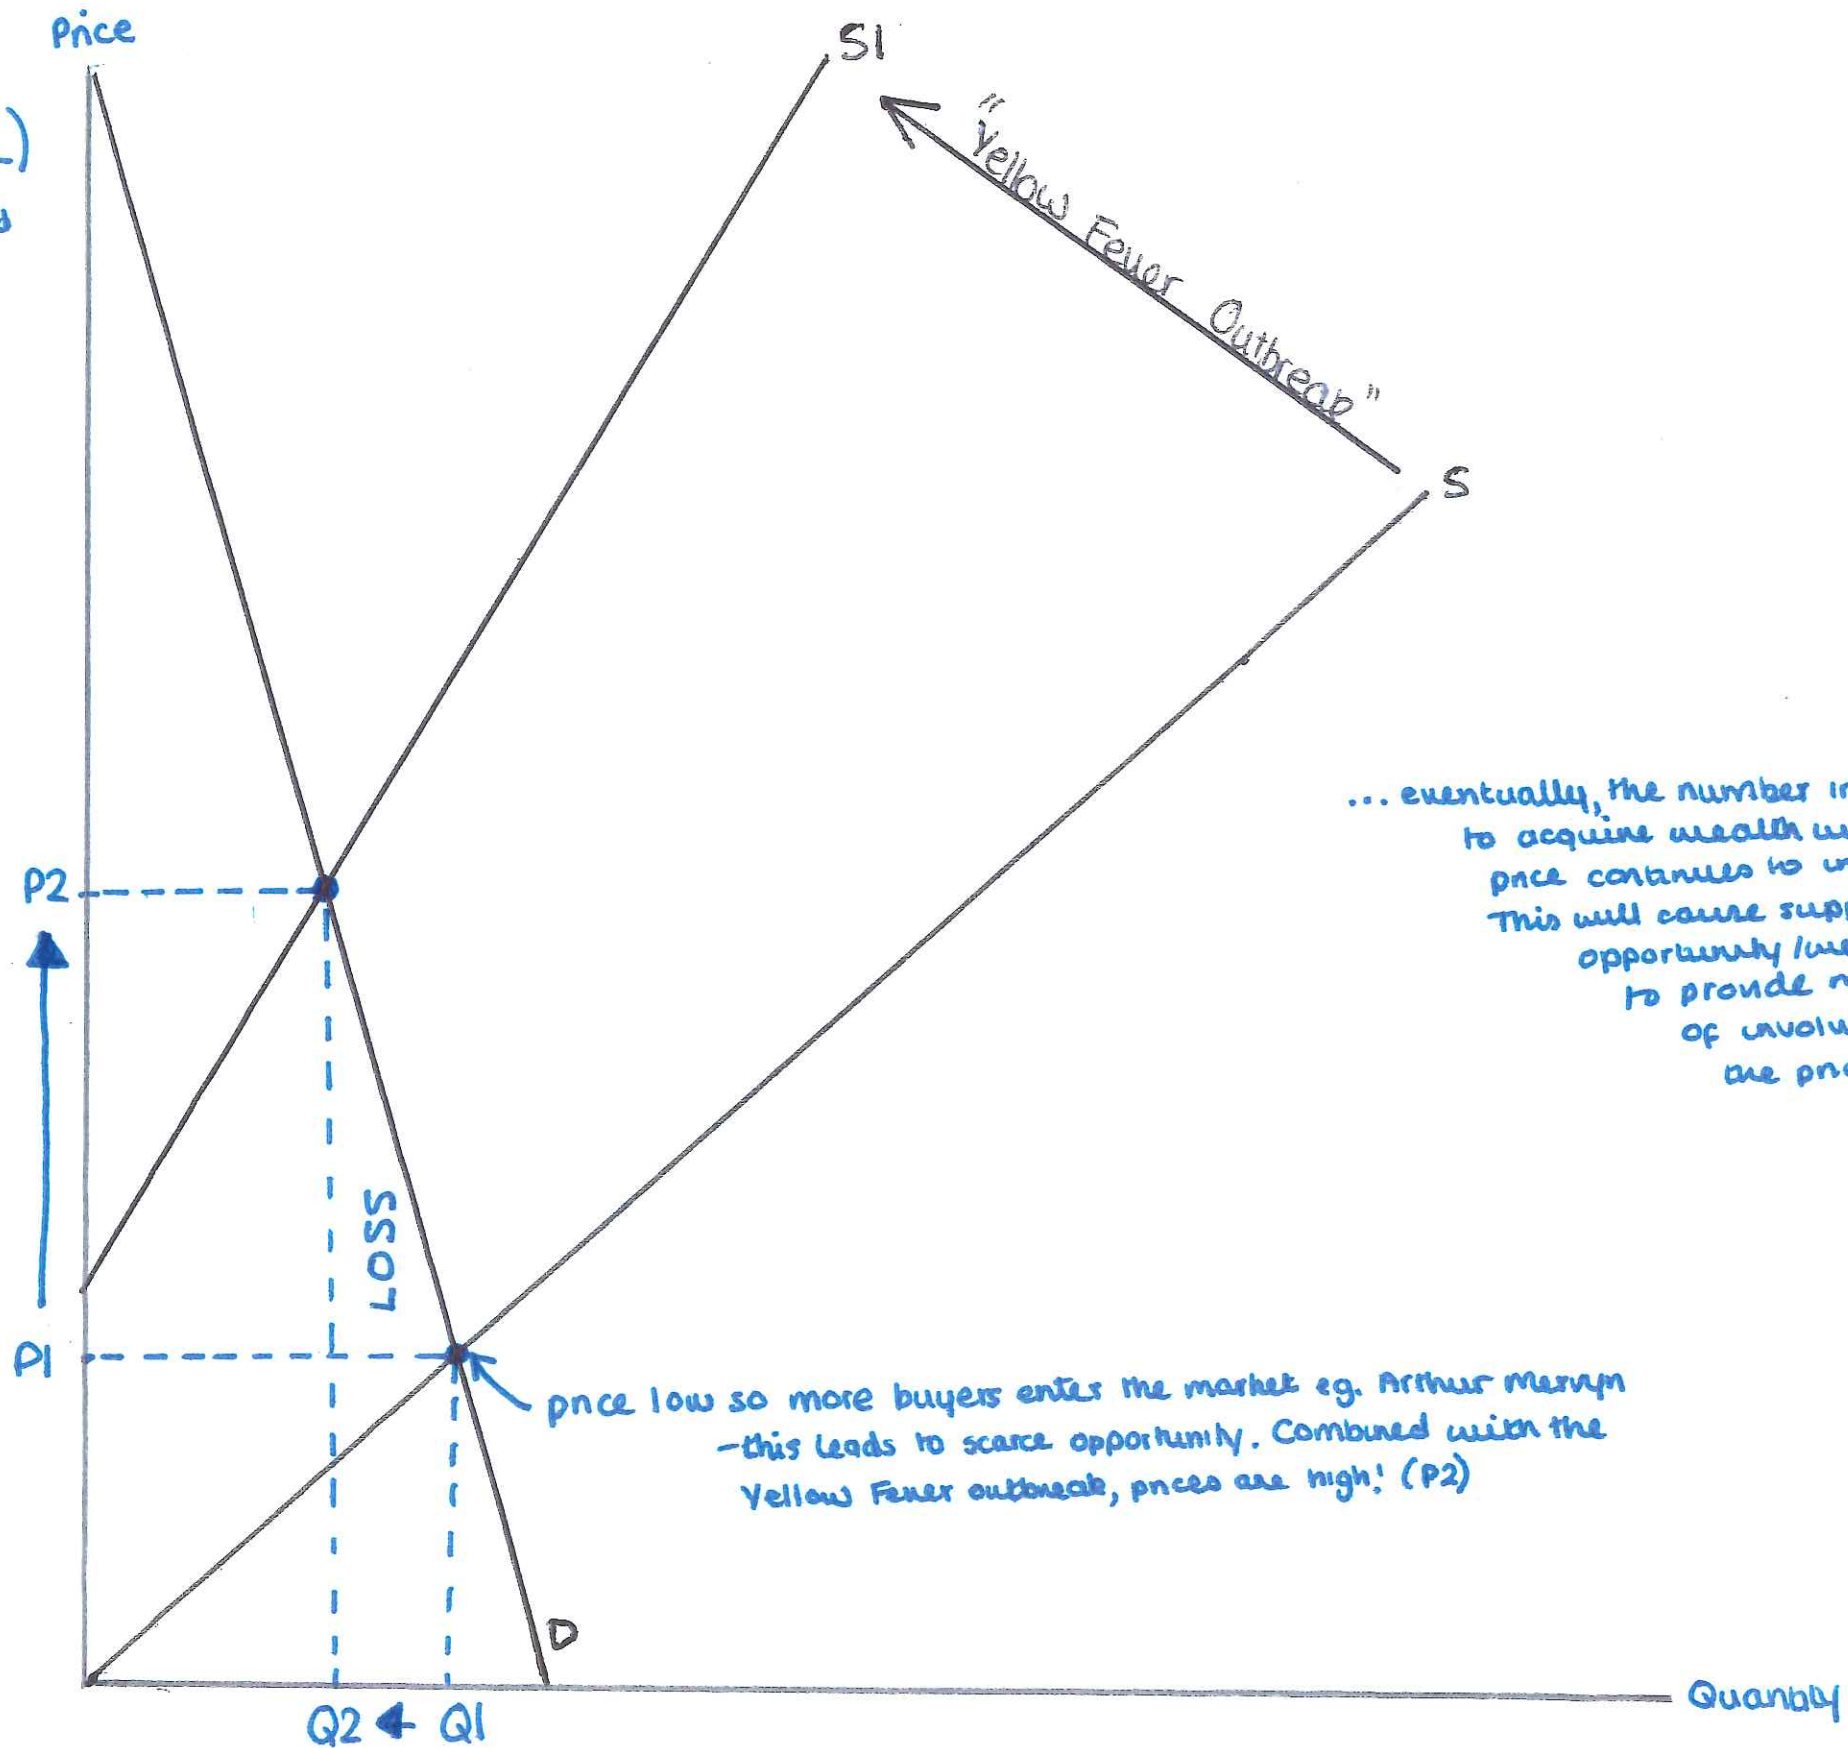

see that it is not entirely inelastic ( $L^p$ ) as there is altruism present within the novel, thus lower demand in some characters' situations for wealth accumulation.

S = Supply

the wealth available in Philadelphia pre - Yellow Fever is elastic, meaning it is easier to come by. There are fewer limitations in the time of free merchant capitalism as empires roll over and tariffs are low.

S1 = Supply Line #1

the wealth available in Philadelphia is harder to attain now. successful people die, opportunity dies. The equilibrium now lies at a point where the price of success is high: murder, lies, sex and crime, even for slightly smaller reward

... eventually, the number in the market to acquire wealth will fall as the price continues to increase. This will cause suppliers of opportunity/wealth/capitalism to provide more chances of involvement thus the price falls due to reduced scarcity, allowing buyers to reenter the market.

price low so more buyers enter the market eg. Arthur Murray - this leads to scarce opportunity. Combined with the Yellow Fever outbreak, prices are high! (P2)
